

# Reluctant acceptance of the literal truth: Eye tracking in the Covered Box Paradigm

SuB20, 2015

University of Tübingen, Tübingen

September 9, 2015

**Florian Schwarz, Cory Bill & Jacopo Romoli**

# Aspects of Meaning: Theory and Processing

- **Overall conveyed meaning** results from conglomerate of inferences
- **Theoretical Question:**  
What aspects of meaning are there?  
(and what are their properties?)
- **Processing Question:**  
How do these aspects of meaning arise in online processing?
- How do answers to each of these questions constrain answers to the other?

# Scalar Implicatures vs. Literal Meaning

- **Some N VP**  
commonly, but not necessarily, conveys that  
**Not all N VP**

- **Two** ingredients:  
**Literal**, conventional meaning:  
[[ **Some N** VP ]] =  $\exists x[N(x) \ \& \ VP(x)]$

**Additional** inference (scalar implicature):  
Not all N VP

—> Based on **contrast** with **stronger alternative**  
**All N VP**

- Implicatures can be **cancelled** or **fail to arise**:  
**Some N VP, in fact they all did.**

# Implicature Processing

- Two prominent **processing models**:

- **Literal First:**

- start with literal, **effortful reasoning** derives implicature  
—> **Literal < Implicature**

- **Default:**

- implicatures** pre-encoded, literal via cancellation  
—> **Implicature < Literal**

- **One line of work: Implicatures slower than literal**

- Response Times: Bott & Noveck (2004)

- Some elephants are mammals.** RTs: T (Lit) < F (Prag)

- Visual World: Huang & Snedeker (2009)

- **Another line: implicatures available immediately**

- (Grodner et al. 2010, Breheny et al. 2013, Degen & Tanenhaus 2011)

# Background for present study

- Previous work: **literal** RTs based on **True** responses, **implicature** RTs based on **False** responses
- Different take: **How easy** are **literal** acceptances relative to **implicature-compatible** acceptances?
- **Romoli & Schwarz 2015:**  
**Implicatures** and **presuppositions under negation** in picture matching paradigm  
  
—> **Implicature** (& presupposition) acceptances **faster than literal**
- **Schwarz, Romoli & Bill 2015:**  
**sometimes** vs. **not always** -  
comparing both **acceptances** and **rejections**

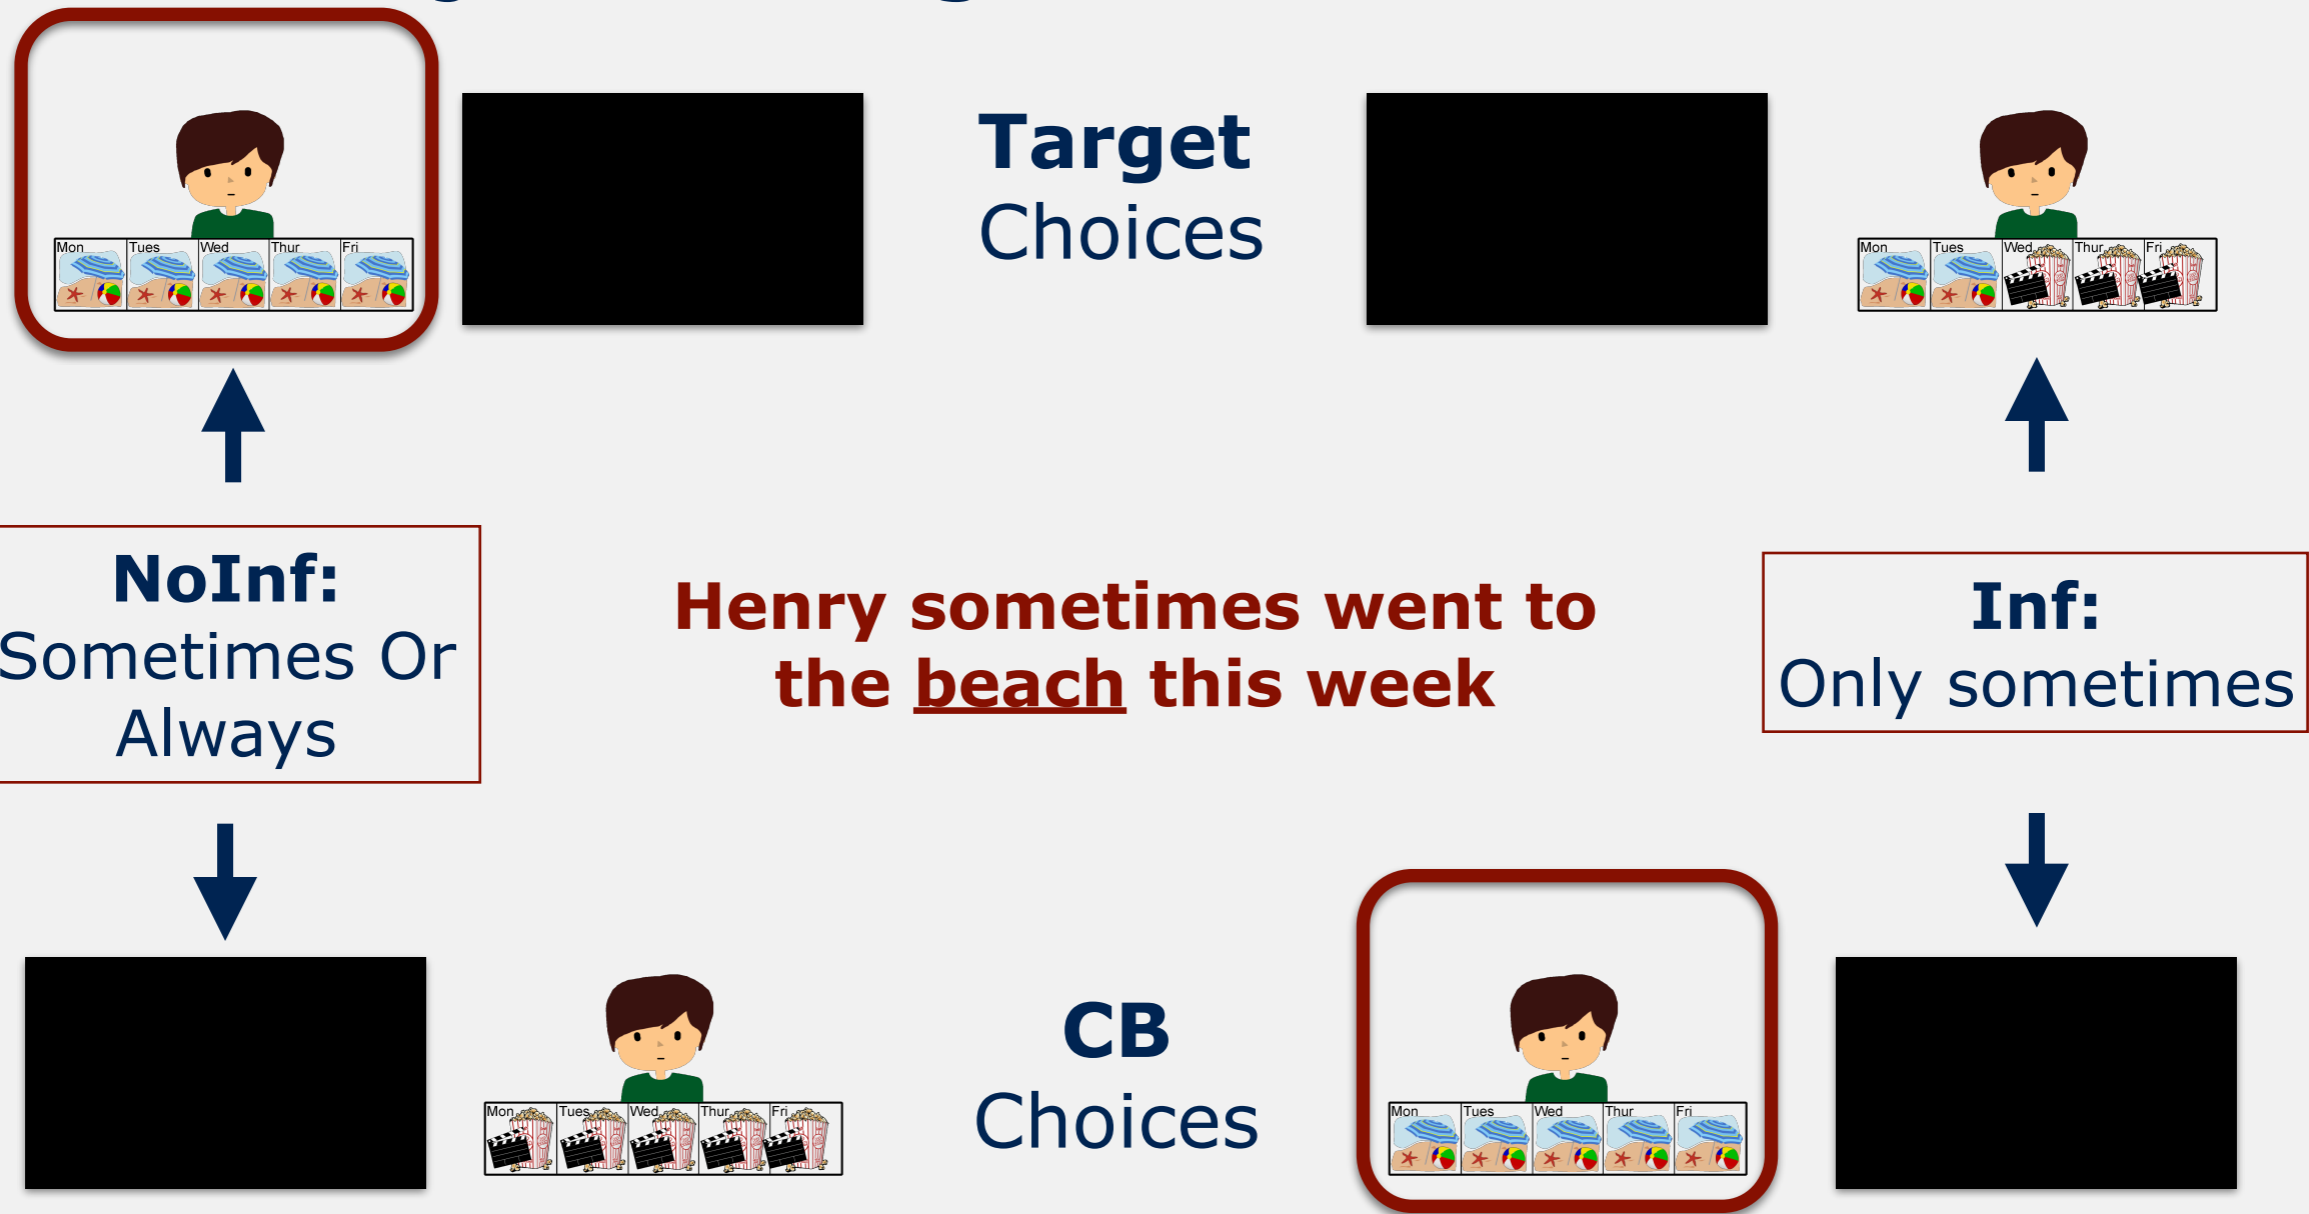

# Calendar Strip + Covered Box

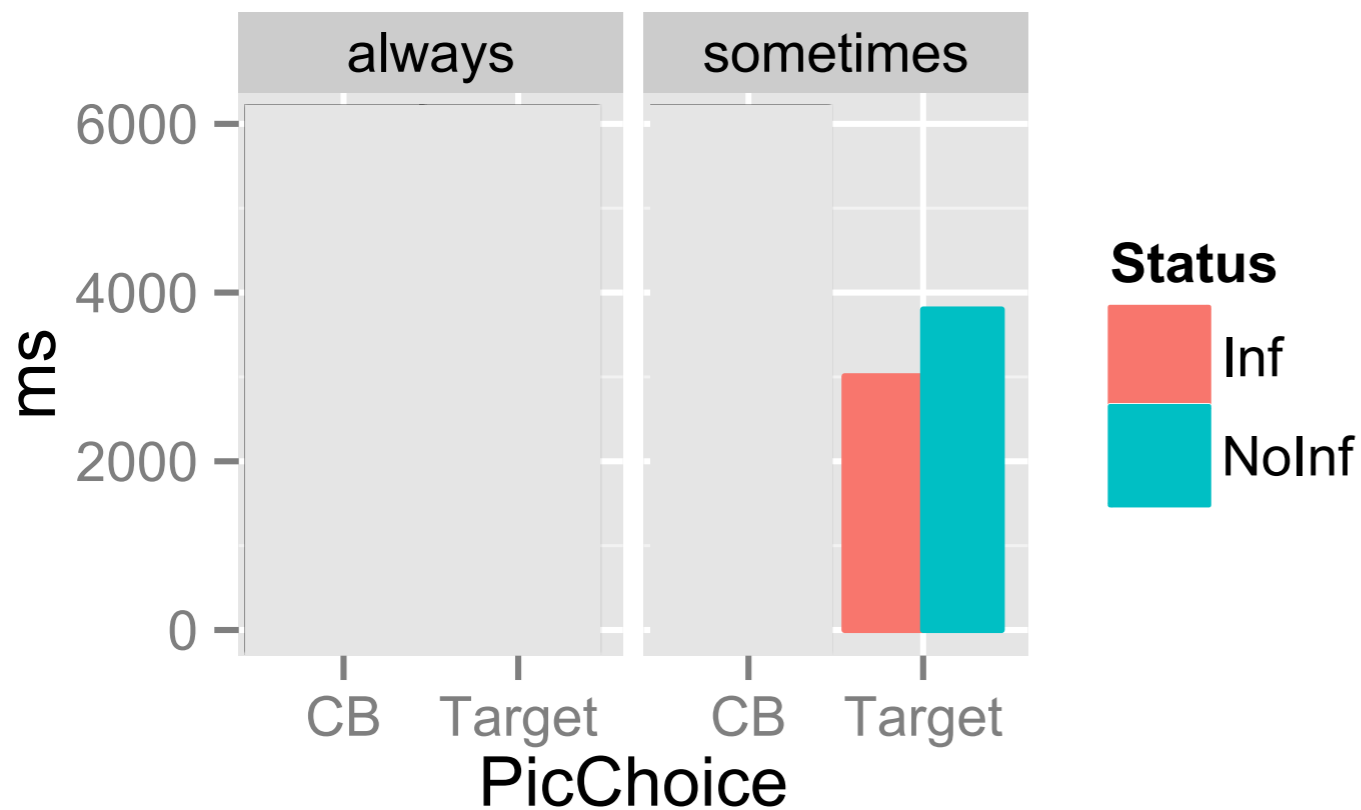

- Iconic **representation of events** in time (versatile format for various triggers)
- **Instructions:**
  - Multiple pictures shown - one hidden.
  - Sentence describes exactly one of them.
  - Which one is the sentence about?

# Like Responses - Sometimes

- Looking at both **Target** and **Covered Box** choices

# Response Times

# Acceptances

sometimes

# Rejections

sometimes

- **2x2 Interactions** (Pic : Status)

- **Simple effects** of Rejection vs. Acceptance

- **Acceptance** (Target) comparison: **Inf < NoInf**

- **Rejections** (CB choices):

**NoInf < Inf**

# Descriptive RT Pattern

- **Delays** come with trials where you could choose **either Target or CB**
- **Different Pressures** favor each
- **Proposal:**  
Delay is due to **resolving conflict** between these different pressures

# Opposing Pragmatic Pressures

- Two opposing pressures:
  - **Preference** for **Implicature** readings (—> CB)
  - **Charity**: preference for **overt picture** (—> Target)
- **Slow downs** when these two **conflict**
- **No appeal** to **costly implicature** computation required  
(but also not incompatible with this)
- **Beyond RTs**: Time course in the Visual World

# Next: Evidence for Competition?

- Can we find **more direct evidence** for **competition effects**?
  - > **Visual world** eye tracking + Covered Box
- Compare **eye-movement patterns** based on **responses & picture types**
- **Additional manipulation:**  
**temporary** conditions:  
**implicature** vs. **literal** ultimately  
has **no crucial role** in decision

# Task Illustration: Literal vs. Imp

**Some of the giraffes have scarves**

**Target**

**Distractor**

**CB**

- **Implicature-compatible** condition (Some-Pic)
- **Literal-only** condition (All-Pic)

**Literal** —> **Target**

**Implicature** —> **CB**

# Task Illustration: Global vs. Temp

Some of the giraffes have scarves

Target

Distractor

CB

- **Implicature**-compatible up to **scarves** (Some-Pic)
- **Literal-only** up to **scarves** (All-Pic)
- Correct choice **always** is **CB**

# Design Overview

- **Two Factors:**

- **Some-Picture vs. All-Picture**

- NP2 match vs. mismatch:  
**Global vs. Temp** (blocked, counterbalanced)

**Some of the giraffes have scarves**

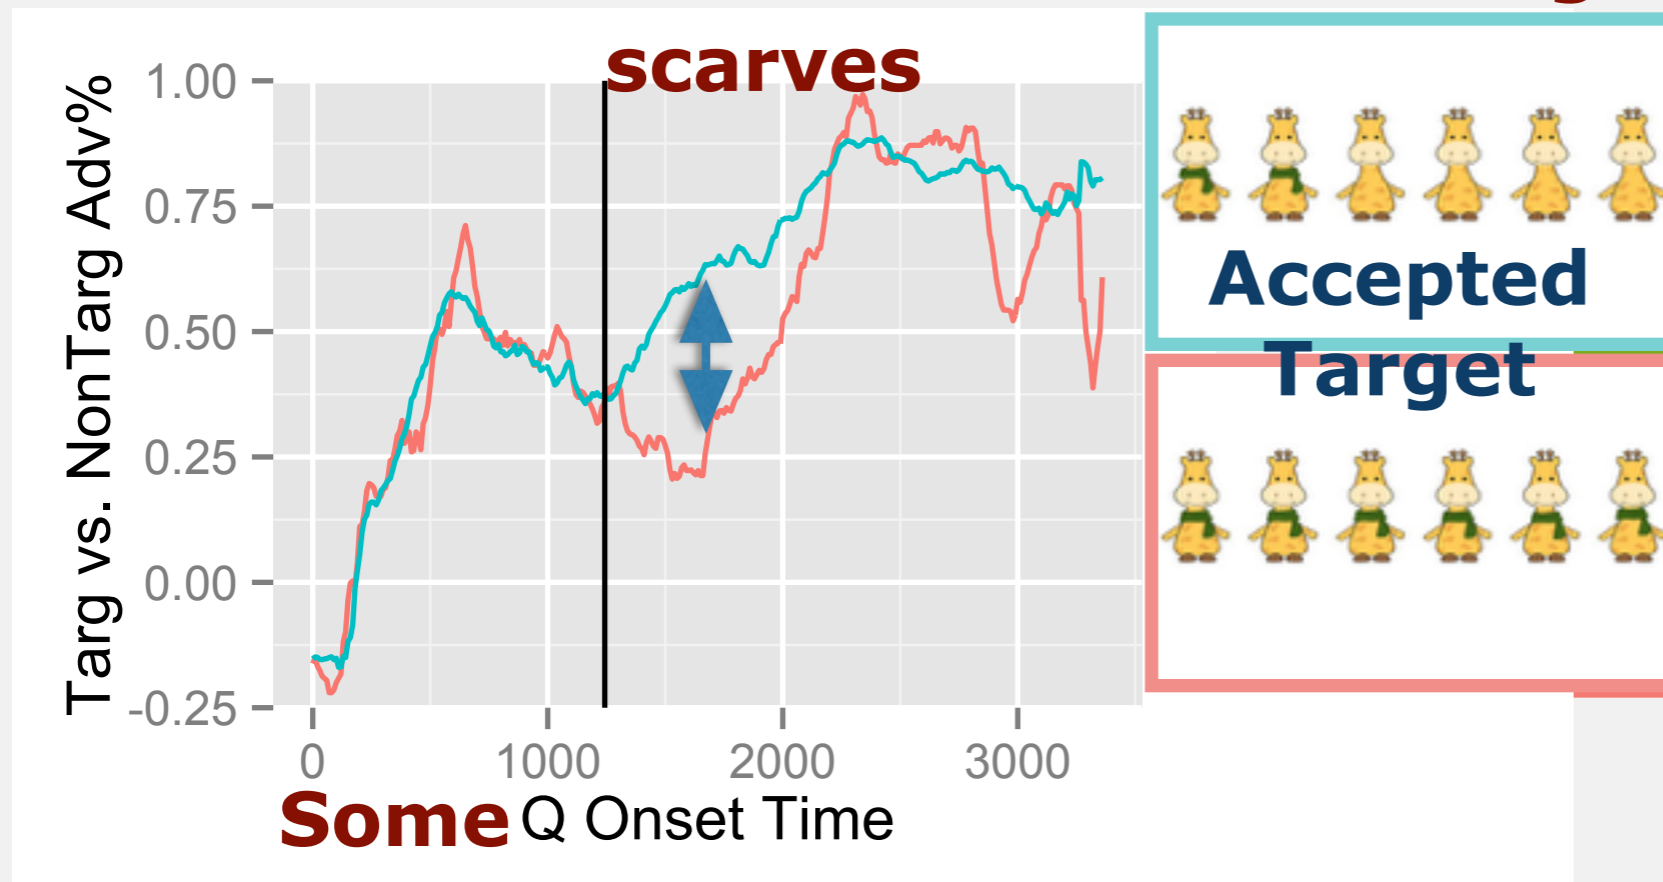

## Target Pic Variations

# More Design Details

- **16 critical** items with some (4 per condition)  
[Temp vs. Global blocked]
- **8 fillers** with **some** [4 True, 4 False with Some-Pic]
- **16 None** fillers  
[True, same Pics as critical → Distractor]
- **16 definite plural fillers** [8 True / 8 False]  
(Maximality never an issue)
- **Notes:**
  - **No All** items! [scalar alternative not made prominent]
  - **Only 4 items** where **implicature mattered** for response
- 78 subjects for course credit at Penn

# Global: All-Pic vs. Some-Pic Acceptances

**Some of the giraffes have scarves**

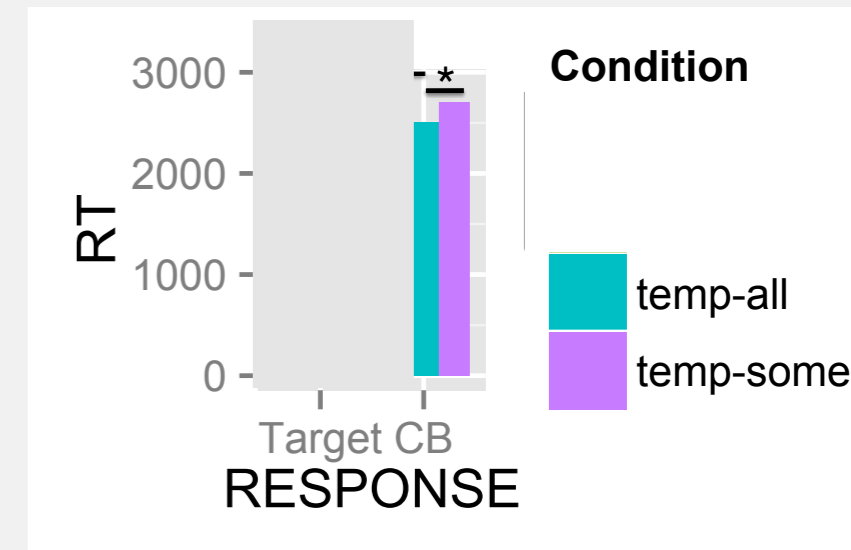

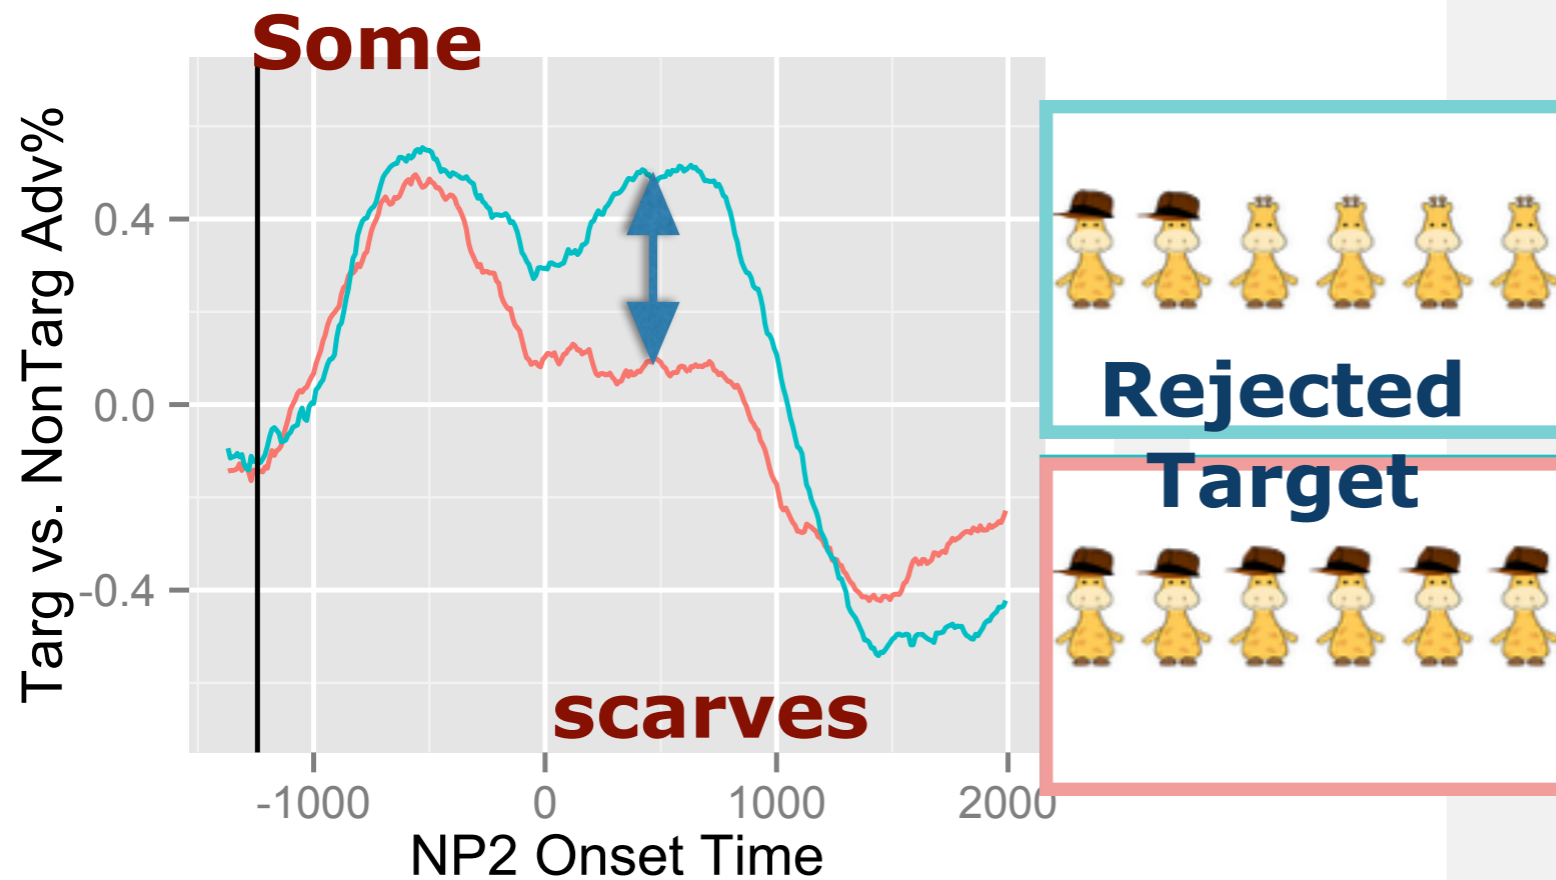

**RTs: Literal Acceptances delayed**

- Even **literal response** trials:  
**eye movements away** from **All-Pic Target!**
- Suggests **consideration of implicature!**  
—> Indication of 'cancellation'

# Temp: All-Pic vs. Some-Pic

Some of the giraffes have scarves

**RTs: Temp Some-Pic rejection delayed**

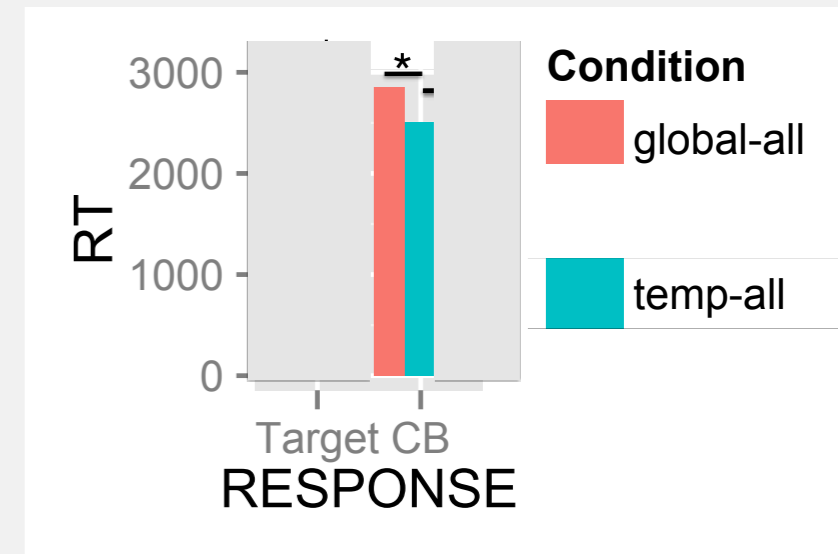

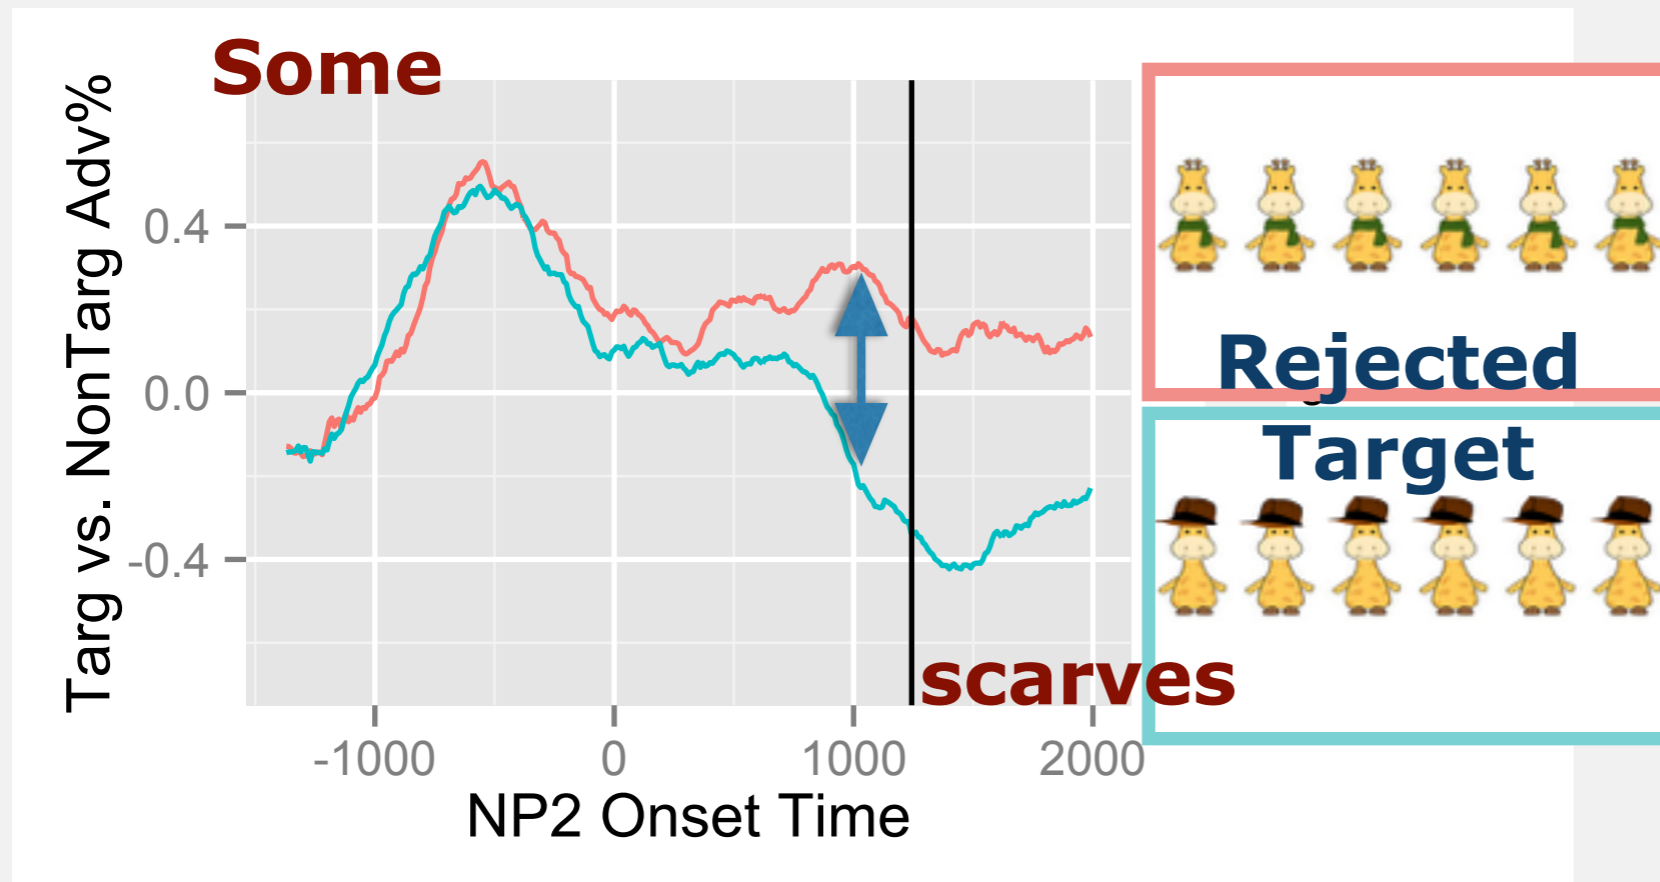

- **Temporary implicature-compatibility:**  
scrutinize picture after hearing **NP2 (scarves)**!
- **Implicature clearly present** and  
able to **speed up Temp-AllPic rejection**

# Summary: Implicature presence

- **Implicature** clearly present even when
  - **ultimate** response is literal
  - it's **irrelevant** due to NP2 mismatch
- **Default** consideration of implicature, and
- **'Cancellation'** in case of literal responses

# Literal present: All-Pic - Global vs. Temp

**Some of the giraffes have scarves**

**RTs: NP2 mismatch rejected faster than Literal interpretation**

- Sustained looks to Target in **Global-All-Pic** CB trials (> Temp from 800ms on)
- Indicates **awareness** of literal alternative

# Discussion

- **Implicature** interpretation considered on literal response trials
- **Literal** interpretation considered on implicature response trials as well!
- **Support** for '**Opposing Pressures**' interpretation: **Eye movements** seem to reflect subjects' **wavering**

# `Ambiguity' is real

- Much of the literature is **framed in terms of only one reading** being **present at different time** points:

**Literal < Implicature OR Implicature < Literal**

- Our data clearly show that **there is a time window** where **both readings are considered** in parallel

—> A matter of **choice between them**,  
NOT whether one or the other is available!

- In line with **Opposing Pressures** interpretation

# Conclusion

- **RT delay data** is **not** indicative of time course of availability
- Once we look at **alike responses**, delays arise when you could answer either way
- **CB Eye tracking** data reveals that regardless of response the respective other interpretation is also present  
(—> Useful methodological tool!)

# Thank You!

# Some Fillers

- 4 Temp block:

Target

Distractor

CB

Some of the giraffes have scarves

- 4 Global block

Target

Distractor

CB

# None Fillers

- 8 Some-Pic False

Target

Distractor

CB

**None of the giraffes have scarves**

- 8 All-Pic False

Target

Distractor

CB

# Definite Plural Fillers

- 8 Def. Pl. True

Target

Distractor

CB

The giraffes have scarves

- 8 Def.Pl. False

Target

Distractor

CB

# Instructions

In this experiment, you will see a number of pictures displayed on the screen. You then will hear some instructions with a description. Your job is to select the picture that matches that description. There is one complication, though: one of the pictures is hidden from view. But since there always is exactly one picture in a given display that matches the sentence, you can safely select that picture if none of the visible pictures is a good fit.

Before each trial, you see a dot in the middle of the screen. Please look at this dot while it's being displayed, so that the trial can begin. Once the pictures are shown, you can look around at the images at your will.

# Priming Effect

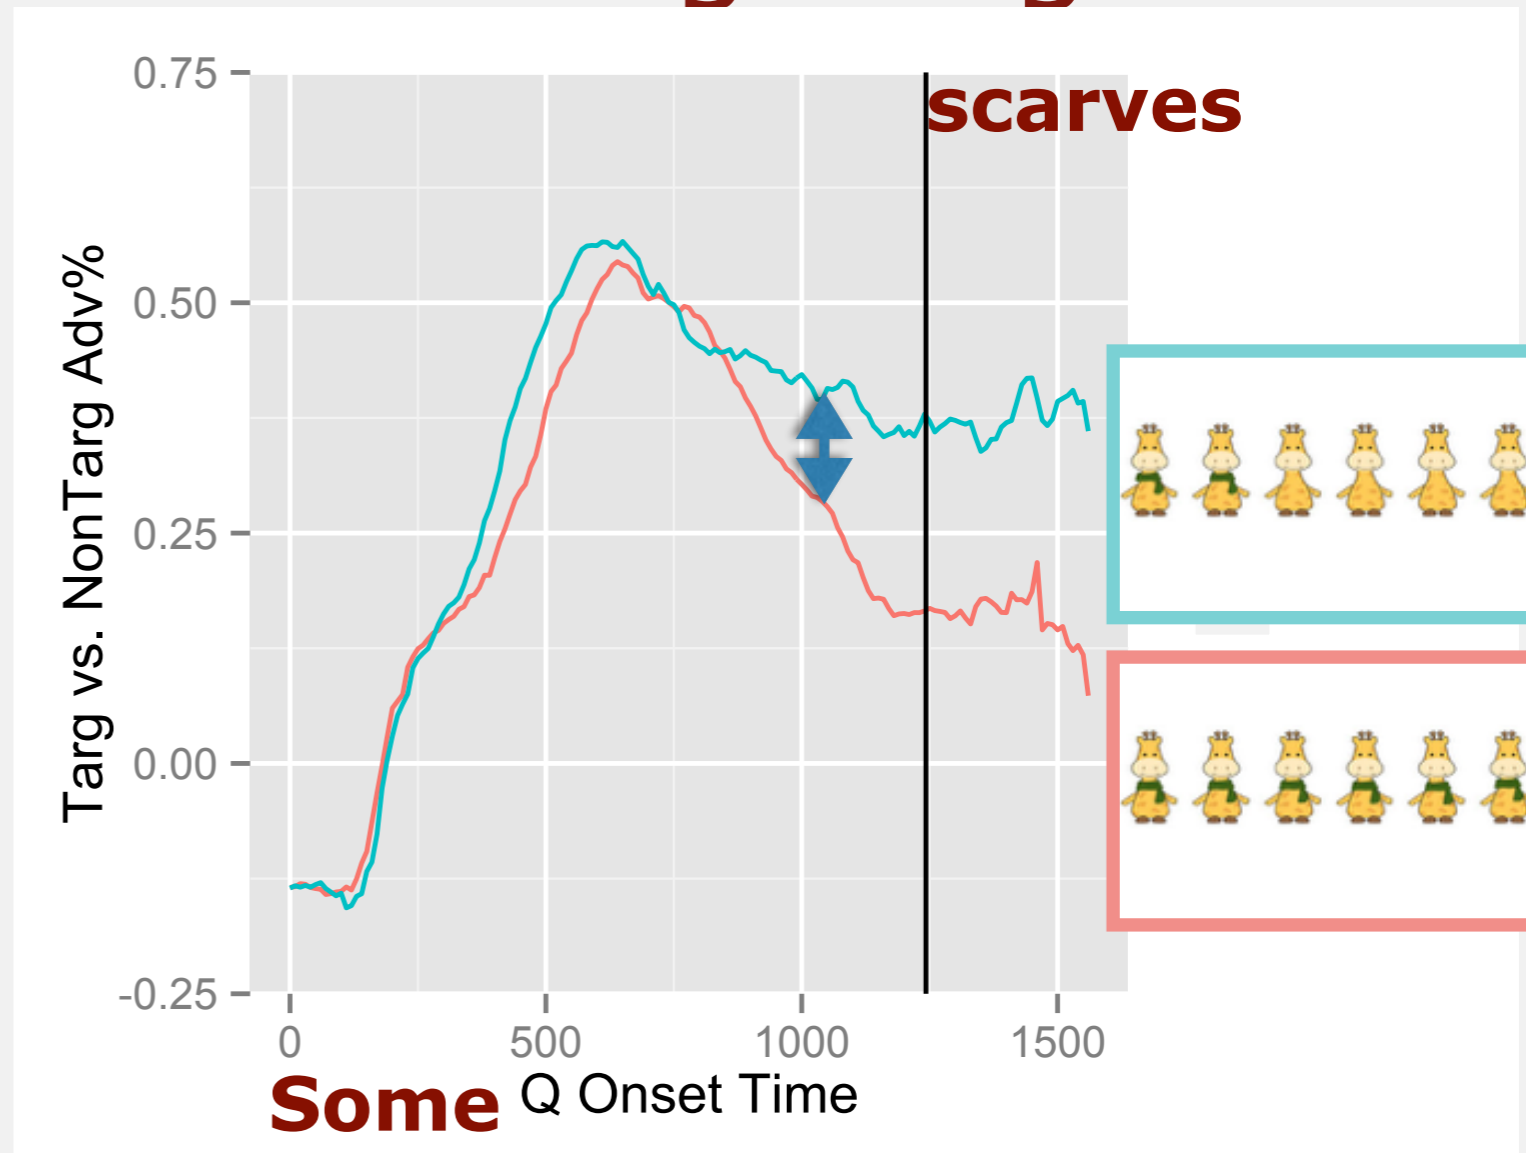

**Some of the giraffes have scarves**

- **All-Pic Temp** rejections **faster after Global All-Pic** (i.e., in 2nd block) (compared to before Global All-Pic)
- **Seeing Global All-Pic** seems to **facilitate early rejection** based on implicature
- **'Implicature priming effect'?**
- **In our terms:** speed-up of conflict resolution

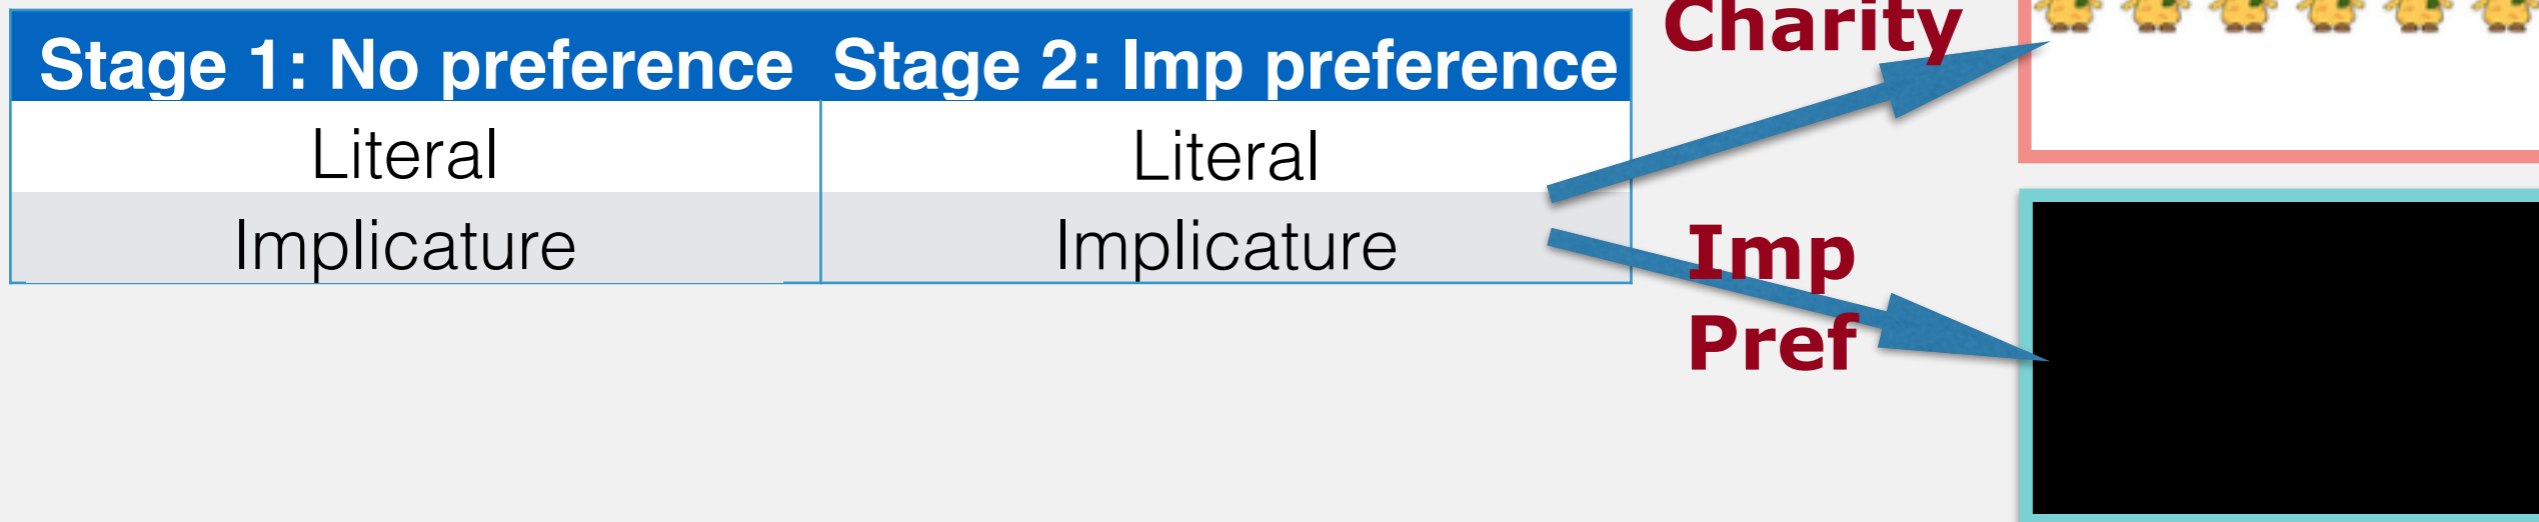

# Early vs. Late Processing Stages

- All our **effects** are quite late
- What happens **early on**?
- **Decrease** in looks to All-Pic after 1000ms
  - >  $\approx$  Huang & Snedeker (but quite different task!)
- **Consistent** with
  - **online delay** in implicature calculation
  - **parallel access** to both meanings with **preference emerging** after delay

# Meaning(s) During Initial Stage

- **Initial stage** could be **ambiguous**:

- Or **literal**:

- Based on our data, **early time-window** effects could be due to  
delay in implicature availability  
OR  
delay in preference unfolding
